TITLE : MANUFACTURE OF FLUORESCENT
SCREEN

ABSTRACT : PROBLEM TO BE SOLVED: To improve the luminescence of a fluorescent screen by providing a first process for transferring the transfer body formed on a base film to a transferred surface and a second process for forming a reflecting layer on the transferred transfer body.

SOLUTION: A transfer body 13 is formed on a base film used as a transfer film 11 for transferring. The transfer body 13 is provided with a separating layer 14 for separating the base film and the transfer body 13, a luminescent phosphor layer 15 and an adhesive layer 16 for sticking the transfer body 13 to the inner face of a screen panel 3. In a first process, the transfer film 11 is kept at the heated state, the adhesive layer 16 is stuck to the inner face of the screen panel 3, the base film is peeled off, and the transfer body 13 is transferred. In a second process, a reflecting layer 17 is laminated on the separating layer 14 of the transfer body 13 by the thin film forming method to form a fluorescent screen. Since the peeling face of the separating layer 14 is made a smooth face, the reflection efficiency of the reflecting layer 17 is good.
